

We mentioned about Smart Home Systems in abstract part and future is going to where technological things are used by everyone. Therefore, not to stay behind technological improvements, people should follow the new things in a new era. Our aim is providing some security support in home that is one of the most valuable belongings for us. Combining the technology and security issues in our lives provides big ease to us. Handling security problems by using technology provides us more efficiency and power that's what many people want when the subject comes to security. In market and real world we have such systems but they are not same with ours. We will aim to bring new features that are unique in smart secure home systems. For adding new dimensions to such a system, we produced some ideas. It explains our aim clearly. Using our home remotely and secure was possible until today. Some parts of our system that we thought uniquely, show differences with competitors'. We want to do more and more comfort people's life. Our first goal taking place with this issue. Meeting the security needs with a smart system will be loved and used from lots of people. We want to share some statistics with you about security issue in home. Around %60 percent of burglars used forcible entry to gain access to a home. A suprising %30 percent entered home through an unlocked door window or other opening without resorting the force. In addition, about %33 percent of intrudes enter a home through front door. That's the one of the reason we use secure system to doors and windows. When the situation like this, why people do not use the system that we produced? We will close a deficit with sensors, lockers, valves and something else. Moreover, the most burglars try to determine if a house has an alarm system before attempting a home invasion. Any kind of security system can decrease the probablity of burglar. Actually if this alarm system is wireless, you have many advantages than other home owners. That's because roughly %25 percent of burglars reported cutting telephone or alarm wires before they broke into the home. Wireless Smart Home Systems that are related to security is less vulnerable. Because there is no wire. If the subject comes to water flood, we will present more statistics too. All of us can go to vacation for long time. And undoubtly, after we headed to the way we go, probablity of forgetting something to close such as water valve, lights or locking doors comes to our minds. We cant turn back. On the other hand, especially in winter , water valves can be exploded due to pressure of water. Everything can be worse if we are not at home. But if we have smart home systems, we can use our mobile phones to do this job for us even we are not at home. All of these are generating the aim of creating this system.
